Abstract

In high energy heavy ion collisions, hot and dense hadronic matter is expected to be in conditions similar to the ones in the early Universe about the few µsec after the Big Bang. Under these conditions, strongly interacting particles may propagate with a mass that differs from the mass in the asymptotic vacuum. Here, we consider \( \pi - \pi \) interactions in the presence of hot and dense pion gas. We study the pion dispersion relation at finite temperature. Back-to-back correlations of observable \( \pi - \pi \) pairs are predicted to appear if the mass of the pions modified in a thermalized medium. This may be an observable effect at the Relativistic Heavy Ion Collider.
