Abstract

Drell-Yan, J/ψ and ψ' production in proton-induced collisions on Be, Al, Cu, Ag and W targets has been studied by the NA50 collaboration at the CERN SPS. The results are needed to fully understand nuclear suppression of the charmonia states and to provide a solid and accurate reference for the study of the anomalous J/ψ suppression, observed by NA50 in Pb-Pb collisions. New results on absolute and relative cross sections based on recently collected high statistics data samples will be presented and discussed in detail.
